What's living
in your
Diesel Fuel?

Cleaning your Fuel

1

My Diesel Fuel is dirty?

There is one simple answer for this question...Very Likely!

Diesel fuel is not what it used to be. The very low sulfur in diesel fuel makes your tank a breeding ground for diesel bugs. There are twenty-seven species of diesel bugs that have been identified. Any one of them, or a combination of them, could be living in your tank. Diesel bugs produce waste products, creating a problem for you: Slime and Acid. These are carried through your entire fuel system, creating a numerous list of maintenance issues.

is a great thing! But we have made a great thing even better! We polish your fuel...

2

Biocides

Using biocide to “clean” your fuel is a common practice.

The problem with this:

Biocide kills the bugs! That’s a great thing! but...those dead bugs then fall to the bottom of your tank creating a layer of sludge.

● LOTS OF DEAD BUGS
CAUSES LOTS OF SLUDGE

● LOTS OF SLUDGE MEANS
COSTLY PROBLEMS

We use biocides during our fuel polishing process, along with three other steps that will not only remove contaminants from your fuel, but will clean the inside of your tank...creating a safe environment for your newly POLISHED fuel!

These Bugs double in population every twenty minutes.

How many Bugs do you have?

3

Why polish my fuel?

- ✓ Improved reliability of your engine and generator
- ✓ Increase power
- ✓ Minimize filter changes
- ✓ Reduction of corrosion within your tank

- ✓ Improved fuel economy
- ✓ Prevention of unnecessary maintenance on injectors and pumps
- ✓ Avoid the need to replace large quantities of bad fuel
- ✓ Increase the lifespan of your fuel
